Literature Number: SNOS733L

# LP2980 Micropower 50 mA Ultra Low-Dropout Regulator In SOT-23 Package

## General Description

The LP2980 is a 50 mA, fixed-output voltage regulator designed specifically to meet the requirements of battery-powered applications.

Using an optimized VIP® (Vertically Integrated PNP) process, the LP2980 delivers unequaled performance in all specifications critical to battery-powered designs:

**Dropout Voltage.** Typically 120 mV @ 50 mA load, and 7 mV @ 1 mA load.

**Ground Pin Current.** Typically 375  $\mu$ A @ 50 mA load, and 80  $\mu$ A @ 1 mA load.

**Sleep Mode.** Less than 1  $\mu$ A quiescent current when ON/OFF pin is pulled low.

**Minimum Part Count.** Requires only 1  $\mu$ F of external capacitance on the regulator output.

**Precision Output.** 0.5% tolerance output voltages available (A grade).

5.0V, 4.7V, 3.3V, 3.0V and 2.5V versions available as standard products.

## Features

- Ultra low dropout voltage
- Output voltage accuracy 0.5% (A Grade)
- Guaranteed 50 mA output current
- Requires only 1  $\mu$ F external capacitance
- < 1  $\mu$ A quiescent current when shutdown
- Low ground pin current at all load currents
- High peak current capability (150 mA typical)
- Wide supply voltage range (16V max)
- Fast dynamic response to line and load
- Low  $Z_{OUT}$  over wide frequency range
- Over-Temperature and Over-Current protection
- -40°C to +125°C junction temperature range

## Applications

- Cellular Phone
- Palmtop/Laptop Computer
- Personal Digital Assistant (PDA)
- Camcorder, Personal Stereo, Camera

$I_{ON/OFF}$	ON/OFF Input Current	$V_{ON/OFF} = 0$	0		<b>-1</b>		<b>-1</b>	$\mu\text{A}$
		$V_{ON/OFF} = 5\text{V}$	5		<b>15</b>		<b>15</b>	
$I_{O(PK)}$	Peak Output Current	$V_{OUT} \geq V_{O(NOM)} - 5\%$	150	100		100		mA
$e_n$	Output Noise Voltage (RMS)	BW = 300 Hz–50 kHz, $C_{OUT} = 10\text{ }\mu\text{F}$	160					$\mu\text{V}$
$\frac{\Delta V_{OUT}}{\Delta V_{IN}}$	Ripple Rejection	$f = 1\text{ kHz}$ $C_{OUT} = 10\text{ }\mu\text{F}$	63					dB
$I_{O(MAX)}$	Short Circuit Current	$R_L = 0$ (Steady State) (Note 9)	150					mA

**Note 1:** Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its rated operating conditions.

**Note 2:** The ESD rating of pins 3 and 4 for the SOT-23 package is 1 kV.

**Note 3:** The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_{J(MAX)}$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation at any ambient temperature is calculated using:

$$P (MAX) = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

The value of  $\theta_{JA}$  for the SOT-23 package is 220°C/W. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown.

**Note 4:** If used in a dual-supply system where the regulator load is returned to a negative supply, the LP2980 output must be diode-clamped to ground.

**Note 5:** The output PNP structure contains a diode between the  $V_{IN}$  and  $V_{OUT}$  terminals that is normally reverse-biased. Reversing the polarity from  $V_{IN}$  to  $V_{OUT}$  will turn on this diode (See *REVERSE CURRENT PATH*).

**Note 6:** Limits are 100% production tested at 25°C. Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's Average Outgoing Quality Level (AOQL).

**Note 7:** Dropout voltage is defined as the input to output differential at which the output voltage drops 100 mV below the value measured with a 1V differential.

**Note 8:** The ON/OFF inputs must be properly driven to prevent misoperation. For details, refer to *ON/OFF INPUT OPERATION*.

**Note 9:** See related curve(s) in *Typical Performance Characteristics* section.

## Typical Application Circuit

1207802

\*ON/OFF input must be actively terminated. Tie to  $V_{IN}$  if this function is not to be used.

\*\*Minimum Output Capacitance is 1  $\mu$ F to insure stability over full load current range. More capacitance provides superior dynamic performance and additional stability margin (see Application Hints).

\*\*\*Do not make connections to this pin.

## Typical Performance Characteristics

Unless otherwise specified:  $T_A = 25^\circ\text{C}$ ,  $V_{IN} = V_{O(NOM)} + 1\text{V}$ ,  $C_{OUT} = 2.2\ \mu\text{F}$ , all voltage options, ON/OFF pin tied to  $V_{IN}$ .

## Application Hints

### OUTPUT CAPACITOR

Like any low-dropout regulator, the LP2980 requires an output capacitor to maintain regulator loop stability. This capacitor must be selected to meet the requirements of minimum capacitance and equivalent series resistance (ESR) range. It is not difficult to find capacitors which meet the criteria of the LP2980, as the acceptable capacitance and ESR ranges are wider than for most other LDOs.

In general, the capacitor value must be at least 1  $\mu\text{F}$  (over the actual ambient operating temperature), and the ESR must be within the range indicated in *Figures 1, 2* and *Figure 3*. It should be noted that, although a maximum ESR is shown in these Figures, it is very unlikely to find a capacitor with ESR that high.

### Tantalum Capacitors

Surface-mountable solid tantalum capacitors offer a good combination of small physical size for the capacitance value, and ESR in the range needed by the LP2980.

The results of testing the LP2980 stability with surface-mount solid tantalum capacitors show good stability with values of at least 1  $\mu\text{F}$ . The value can be increased to 2.2  $\mu\text{F}$  (or more) for even better performance, including transient response and noise.

Small value tantalum capacitors that have been verified as suitable for use with the LP2980 are shown in *Table 2*. Capacitance values can be increased without limit.

### Aluminum Electrolytic Capacitors

Although probably not a good choice for a production design, because of relatively large physical size, an aluminum electrolytic capacitor can be used in the design prototype for an LP2980 regulator. A value of at least 1  $\mu\text{F}$  should be used, and the ESR must meet the conditions of *Figures 1, 2* and *Figure 3*. If the operating temperature drops below 0°C, the regulator may not remain stable, as the ESR of the aluminum electrolytic capacitor will increase, and may exceed the limits indicated in the Figures.

**TABLE 2. Surface-Mount Tantalum Capacitor Selection Guide**

Sprague	293D225X0010A2T

### Multilayer Ceramic Capacitors

Surface-mountable multilayer ceramic capacitors may be an attractive choice because of their relatively small physical size and excellent RF characteristics. However, they sometimes

have ESR values lower than the minimum required by the LP2980, and relatively large capacitance change with temperature. The manufacturer's datasheet for the capacitor should be consulted before selecting a value.

Test results of LP2980 stability using multilayer ceramic capacitors show that a minimum value of 2.2  $\mu\text{F}$  is usually needed for the 5V regulator. For the lower output voltages, or for better performance, a higher value should be used, such as 4.7  $\mu\text{F}$ .

Multilayer ceramic capacitors that have been verified as suitable for use with the LP2980 are shown in *Table 3*.

FIGURE 3. 10 µF ESR Range

### REVERSE CURRENT PATH

The internal PNP power transistor used as the pass element in the LP2980 has an inherent diode connected between the regulator output and input. During normal operation (where the input voltage is higher than the output) this diode is reverse biased (See Figure 4).

FIGURE 4. LP2980 Reverse Current Path

However, if the input voltage is more than a  $V_{BE}$  below the output voltage, this diode will turn ON and current will flow into the regulator output. In such cases, a parasitic SCR can latch which will allow a high current to flow into the  $V_{IN}$  pin and out the ground pin, which can damage the part.

The internal diode can also be turned on if the input voltage is abruptly stepped down to a voltage which is a  $V_{BE}$  below the output voltage.

In any application where the output voltage may be higher than the input voltage, an external Schottky diode must be connected from  $V_{IN}$  to  $V_{OUT}$  (cathode on  $V_{IN}$ , anode on  $V_{OUT}$ ). See Figure 5, to limit the reverse voltage across the LP2980 to 0.3V (See *Absolute Maximum Ratings*).

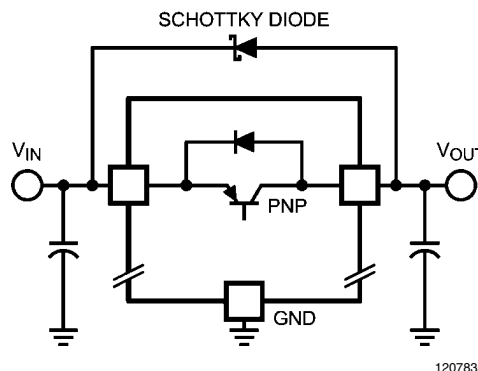

FIGURE 5. Adding External Schottky Diode Protection

### ON/OFF INPUT OPERATION

The LP2980 is shut off by pulling the ON/OFF input low, and turned on by driving the input high. If this feature is not to be used, the ON/OFF input should be tied to  $V_{IN}$  to keep the regulator on at all times (the ON/OFF input must **not** be left floating).

To ensure proper operation, the signal source used to drive the ON/OFF input must be able to swing above and below the specified turn-on/turn-off voltage thresholds which guarantee an ON or OFF state (see *Electrical Characteristics*).

The ON/OFF signal may come from either a totem-pole output, or an open-collector output with pull-up resistor to the LP2980 input voltage or another logic supply. The high-level voltage may exceed the LP2980 input voltage, but must remain within the *Absolute Maximum Ratings* for the ON/OFF pin.

It is also important that the turn-on/turn-off voltage signals applied to the ON/OFF input have a slew rate which is greater than 40 mV/µs.

**IMPORTANT:** The regulator shutdown function will not operate correctly if a slow-moving signal is used to drive the ON/OFF input.

## Increasing Output Current

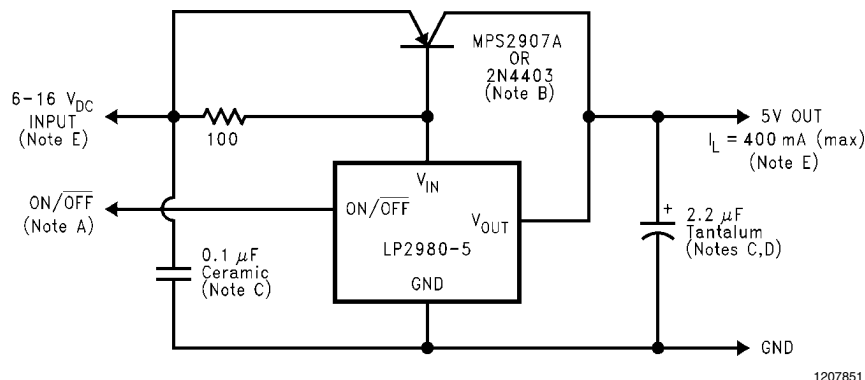

FIGURE 6. 5V/400mA Regulator

The LP2980 can be used to control higher-current regulators, by adding an external PNP pass device. With the PNP transistors shown in *Figure 6*, the output current can be as high as 400 mA, as long as the input voltage is held within the Safe Operation Boundary Curves shown below in *Figure 7*.

To ensure regulation, the minimum input voltage of this regulator is 6V. This "headroom" is the sum of the  $V_{BE}$  of the external transistor and the dropout voltage of the LP2980.

### Notes:

A. Drive this input with a logic signal (see Application Hints). If the shutdown function is not to be used, tie the ON/OFF pin directly to the  $V_{IN}$  pin.

B. Recommended devices (other PNP transistors can be used if the current gain and voltage ratings are similar).

C. Capacitor is required for regulator stability. Minimum size is shown, and may be increased without limit.

D. Increasing the output capacitance improves transient response and increases phase margin.

E. Maximum safe input voltage and load current are limited by power dissipation in the PNP pass transistor and the maximum ambient temperature for the specific application. If a TO-92 transistor such as the MPS2907A is used, the thermal resistance from junction-to-ambient is 180°C/W in still air.

Assuming a maximum allowable junction temperature of 150°C for the MPS2907A device, the following curves show the maximum  $V_{IN}$  and  $I_L$  values that may be safely used for several ambient temperatures.

FIGURE 7. Safe Operation Boundary Curves for *Figure 6*

FIGURE 8. 5V to 3.3V @ 3A Converter

With limited input voltage range, the LP2980 can control a 3.3V, 3A regulator with the use of a high current-gain external PNP pass transistor as shown in Figure 8. If the regulator is to be loaded with the full 3A, heat sinking will be required on the pass transistor to keep it within its rated temperature range. Refer to the Heatsink Thermal Resistance Requirements, below. For best load regulation at the high load current, the LP2980 output voltage connection should be made as close to the load as possible.

Although this regulator can handle a much higher load current than can the LP2980 alone, it can be shut down in the same manner as the LP2980. When the ON/OFF control is brought low, the converter will be in shutdown, and will draw less than 1  $\mu$ A from the source.

**Notes:**

A. Drive this input with a logic signal (see Application Hints). If the shutdown function is not to be used, tie the ON/OFF pin directly to the  $V_{IN}$  pin.

B. Capacitor is required for regulator stability. Minimum size is shown, and may be increased without limit.

C. Increasing the output capacitance improves transient response and increases phase margin.

D. A heatsink may be required for this transistor. The maximum allowable value for thermal resistance of the heatsink is dependent on ambient temperature and load current (see curves in Figure 9). Once the value is obtained from the graph, a heatsink must be selected which has a thermal resistance equal to or lower than this value. If the value is above 60°C/W, no heatsink is required (the TO-220 package alone will safely dissipate this).

For these curves, a maximum junction temperature of 150°C is assumed for the pass transistor. The case-to-heatsink attachment thermal resistance is assumed to be 1.5°C/W. All calculations are for 5.5V input voltage (which is worst-case for power dissipation).

TESTING AND OTHER QUALITY CONTROLS ARE USED TO THE EXTENT NATIONAL DEEMS NECESSARY TO SUPPORT NATIONAL'S PRODUCT WARRANTY. EXCEPT WHERE MANDATED BY GOVERNMENT REQUIREMENTS, TESTING OF ALL PARAMETERS OF EACH PRODUCT IS NOT NECESSARILY PERFORMED. NATIONAL ASSUMES NO LIABILITY FOR APPLICATIONS ASSISTANCE OR BUYER PRODUCT DESIGN. BUYERS ARE RESPONSIBLE FOR THEIR PRODUCTS AND APPLICATIONS USING NATIONAL COMPONENTS. PRIOR TO USING OR DISTRIBUTING ANY PRODUCTS THAT INCLUDE NATIONAL COMPONENTS, BUYERS SHOULD PROVIDE ADEQUATE DESIGN, TESTING AND OPERATING SAFEGUARDS.

EXCEPT AS PROVIDED IN NATIONAL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, NATIONAL ASSUMES NO LIABILITY WHATSOEVER, AND NATIONAL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY RELATING TO THE SALE AND/OR USE OF NATIONAL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

## LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
